

Creating a PDF via Postscript and Acrobat Distiller:

This is not our preferred way anymore, but if you insist here are our instructions. Please be informed that when printing to Postscript transparencies are flattened which causes unforeseeable problems with fully colour managed workflows.

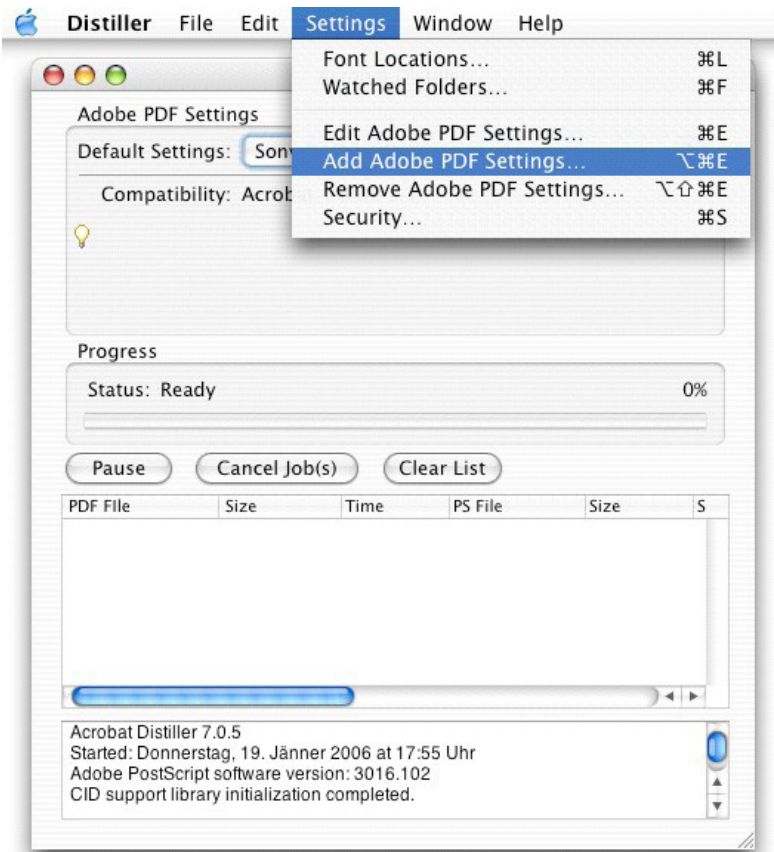

- 1.) Open folder "Settings Adobe InDesign/PDF via PostScript/" and choose between folder "Mac" or "PC". Now follow the instructions in file "Readme first.txt".
- 2.) Load the appropriate presets (.prst) for your version of InDesign from the folder "PDF via PostScript" (choose from PC or Mac).
- 3.) Use generic PPD if InDesign cannot locate the PPD specified in our preset. Then edit the preset and choose „Adobe PDF" or „Adobe PDF 7.0/8.0" and enter new values section "Setup"

- 4.) Open your document, press "Apple/ Strg. P", and choose the Sony DADC setting from "Print Preset". After adopting them for your specific product (e.g. page size) press the Button "OK" and output as postscript file.

5.) Import the Sony DADC HiRes Setting into Acrobat Distiller to be found under “Support Files/Acrobat Distiller Settings” and use them for every PDF you’d like to send to Sony DADC.

6.) Drag the Postscript file into the Acrobat Distiller window and receive a high resolution PDF.
